HOW IT WORKS:

Dust and particulate enter the HYDROMAX® wet collector through ducting in the rear of the filter cabinet. The contaminated air is mixed into a turbulent water bath, and runs through a series of internal baffles. The engineered baffles, and water streams filter and drop out the combustible dust where it is contained in the bottom of the collector for safe removal, at necessary intervals with the provided sludge rake. Water levels are automatically controlled through our flow valve system that can be interlocked with the dust producing equipment to meet OSHA and NFPA requirements for combustible dusts.
