HOW IT WORKS:

Contaminated air is pulled into the tangential inlet on the side of the RP1 Cabinet. Centrifugal force moves the heavy dust to the interior sidewalls and drops it out to the cylindrical hopper at the bottom of the unit. Finer dust particles are captured through the cartridge filter section, where the contaminant is filtered and dropped into the hopper during the cartridge cleaning cycle. Breathe Easy, clean safe air is exhausted out the top of the unit.

ROTO-PULSE®

Cartridge cleaning is accomplished with Micro Air's proprietary **Roto-Pulse®** cleaning system, where air is pulsed into a specially designed stainless steel, rotating tube, engineered with pre-drilled holes. As the air enters this tube, the force of the pulse causes the tube to rotate incrementally inside the cartridge. While rotating, air exits the pre-drilled holes, resulting in air dispersement over the entire surface of the cartridge, providing for an improved cartridge cleaning cycle, compared to competitive backflush cleaning systems.
