HOW IT WORKS

The future of oil mist

filtration is here with Micro Air's newest development, the patented, extended life, multi-

layered **MISTMAX™** oil mist filter. This new technology incorporates Brownian diffusion techniques (smaller particles randomly combine to form larger, more easily removed particles) along with traditional impingement technologies to provide the newest

technological advancement in mist filtration.

Depending on the application **MISTMAX™** filters

will provide 1-5 year filter life in applications such as high-speed machining centers, heat treating, cold drawing, gear cutting etc., operations once deemed too tough for traditional methods of mist collection. Mist laden air flows through the inlet or inlets into the bottom plenum. The air then turns 90 degrees and goes upward through the exclusive Mist-X pre-separation filter where most of the oil is removed. Finally, the air goes through the two 99.98% efficient

MISTMAX™ filters. These special filters remove any remaining mist and smoke. Clean air is

then discharged at the top of the unit. Oil, removed from the airstream, drains out the bottom of the plenum.
